Applied Computing (A)

Instructor: Sir Moaz

Topic:

Online Food Ordering
Management System

Purpose:

Purpose of an online ordering management system is to provide digital platform where customers can view menu, select items, places order, make payment and experienced easy flow of making orders.

It also helps businesses to manage products, items, customer's data requirements and other such issues.

APM

Users:

- * Customers, (placing orders) wants to experience an easy and reliable ordering experience
- * Business / Restaurant Owners, wants efficient order flow & business management
- * Staff / Employee, use easy system to manage orders efficiently-
- * Marketing Teams, To make their platform big and provides best features

Stakeholders:

Stakeholders include in this system can be,

- Business Owner
- Delivery Managers
- Marketing Team
- System Developers

Functional Requirements

Login Page

System should allow to Sign up, Login accounts and manage their personal information.

Menu Page

Customers can see, add, edit, delete items from different categories, can see descriptions, price, In-Stock, Out-of-Stock items

Checkout Page

After adding items to Cart, customers should re-direct to APM

Date:

checkout page where they can select payment method, (cash, card), order management or handling (delivery, collection, dine In)

Non Functional Requirements

How well the system should manage-

- Performance ; system should be quick, navigation should be easy.
- Security ; login password, data management and security.
- Availability ; Timings of that business (opening hours)
- Usability ; easy to understand, easy to handle product / items.

3 Risks

There can be some risks ;
APM

1- Security

Anyone can gain access to customers personal data.

2- System Lagging

Site can become unavailable, customers may not be able to place orders & business can face loss-

3- Technical Errors

Errors in placing orders, payment methods, selecting wrong items could result in loss.

Quality Attributes

* System should process orders correctly without causing an error -

* System should protect customers personal informations -

* System should be user friendly for both customers & staff -

Date:

Where AI could be used

- * Product searching in categories
- * Telling about availability of items
- * Recommending famous, frequently ordered items -
- * Information about food allergens -
- * Provide customer support, telling about food preparation time, delivery areas availability etc.

Incorrect use of AI

- * can reveal unnecessary data -
- * wrong information about products
- * Incorrect details about orders, payments, allergens, prices -
- * Making customers confuse about items -
